PROFILE AND OBJECTIVE

Final-year Applied Artificial Intelligence student (predicted First Class Honours, May 2027) who works between clients and engineering teams. Currently leads requirements gathering and weekly delivery for a three-institution education client with a 15-person team, and acts as technical lead and client contact for an AI-assisted screening tool for a UK private clinic. Combines hands-on Python and LLM skills with clear communication in English, French and Spanish. Seeking a graduate Solutions Engineer, Implementation Engineer or Technology Consultant role from May 2027.

EDUCATION AND QUALIFICATIONS

University of Bradford **Sept 2023 to May 2027**
BSc (Hons) Applied Artificial Intelligence (with Foundation Year) **Predicted: First Class Honours**

- *University Projects*: for details, please see the 'University Projects' section below.
- *Key Modules (Final Year, current)*: Industrial AI Project; The Applied AI Professional.
- *Key Modules (Year 2 and Year 1)*: YR2: Safe AI: Ethics, Law and Governance (67%); Discipline-specific Artificial Intelligence Project (66%). YR1: Fundamentals of Artificial Intelligence and Data Analytics (74%); Machine Learning Methods and Models (70%).
- *Foundation Year*: Digital Media and Software (82%); Introduction to Maths, Data Analysis and Statistics (72%); Introduction to Computer Science and Systems (72%).

New Century Institute of Learning, Yaoundé, Cameroon **2019 to 2023**
GCE Advanced Level (Science): Computer Science (A), Mathematics (B), Applied Mathematics (B), Physics (B).

Professional Certifications
CMI Level 5 in Management · HarvardX CS109xa: Python for Data Science and Machine Learning · IBM Introduction to Generative AI.

TECHNICAL AND SOFTWARE SKILLS

- **Programming Languages**: Python, TypeScript, SQL.
- **Generative AI**: Anthropic Claude API, OpenAI API, LangGraph, tool calling, structured outputs, LLM evaluation.
- **Backend and Data**: Supabase (PostgreSQL, Row-Level Security), FastAPI, REST APIs.
- **Frontend and Mobile**: React, React Native, Expo.
- **Development Tools**: Git, GitHub, Vercel, Playwright, Claude Code.
- **Machine Learning**: supervised learning and model comparison (Random Forest, SVM, XGBoost), scikit-learn.
- **Delivery Methods**: requirements gathering, solution architecture, Agile (weekly sprints with a rotating Scrum Master).

UNIVERSITY PROJECTS

Final Year Project: MenoClinic, AI-Assisted Patient Screening (Industrial AI Project) **Oct 2026 to Present**
Technical Lead and client point of contact, team of three, live client: a UK private menopause clinic

- Act as sole point of contact with the clinic's founder, a registered independent prescriber, running requirements sessions focused on clinical outcomes and workflow.
- Designed the system architecture: deterministic red-flag rules, an AI-drafted summary linked to the patient's original answers, and clinician sign-off on every case.
- Agreed measurable targets with the client before build: 100% red-flag sensitivity, 85 to 95% triage accuracy and at least 50% screening time saved, tested on clinician-approved synthetic cases.
- Kept the first phase separate from the clinic's live booking system, with UK GDPR and clinical safety requirements captured from the start.

Venture Project: SiteDue, Billing Software for Field Engineers **Oct 2026 to Present**

Technical and Product Lead, team of five

- Lead a web app that turns completed field jobs into billing-ready records for UK commercial electrical maintenance firms (React, Supabase).
- Coordinate backend, frontend, voice and customer-research workstreams, and shape the product from customer interviews.

Independent Project: pierre-agent-evals, LLM Agent Evaluation Harness (Python) **Jan 2025 to Mar 2025**

- Built a harness that runs an AI agent through a task suite and scores each run with programmatic checks and an LLM judge, tracking pass rate, cost and latency.
- Showed in a controlled test that cutting the agent's step budget from 10 to 3 dropped the pass rate from 8/8 to 5/8, with every failure traced to premature termination.
- Found and fixed a configuration bug in the test runner and added a regression test for it.

Machine Learning Project: Parkinson's Disease Detection (Python)

- Built a classification pipeline to detect Parkinson's disease, training and comparing Random Forest, SVM and XGBoost models to select the best performer.

EMPLOYMENT AND VOLUNTARY WORK EXPERIENCE

Afryx Labs, Leeds and Yaoundé (remote) **Apr 2026 to Present**

Founder and Technical Lead (client delivery consultancy)

Kampus: school management platform, delivered jointly with Kaeyros Analytics

- Lead requirements gathering for Fang, a private education group with three institutions (Institut Privé Fang, Institut Supérieur Fang, Centre de Formation Fang), each needing its own tailored software.
- Translate client needs into specifications for a joint Afryx and Kaeyros team of 15, directing delivery alongside the Kaeyros technical lead.
- Run a weekly client loop across 16 meetings to date: demo progress, capture changes and missing features, reprioritise with the team and present the next iteration.
- Coordinate two organisations working as one delivery team, from first client sign-off through active build.

KEY EMPLOYABILITY SKILLS

- **Communication**: present progress to non-technical clients every week on Kampus, and translate their feedback into clear specifications for engineers.
- **Team Working**: coordinate a 15-person team across two organisations and two countries, and a three-person university team with shared ownership of research, design and evaluation.
- **Problem Solving and Analytical**: designed MenoClinic so that safety rules, not the AI, decide red flags, and test agent failures with measured experiments rather than guesswork.
- **Commercial Awareness**: scope work around client constraints such as budget, live systems and data protection, as with keeping MenoClinic's booking system untouched.
- **Languages**: English (fluent), French (native), Spanish (conversational); work with French-speaking clients and teams in Cameroon.

LEISURE INTERESTS

- **Football**: play recreationally with friends; enjoy the teamwork and quick decision-making the game demands.
- **Strength and Conditioning**: follow a structured four-day-a-week athletic training programme with set goals and regular progress tests.
- **Reading**: read business and technology books, and keep up with developments in applied AI.
